

Dataverse Hub & Dataverse Marketplace

Harnessing the Creativity & Power of the Dataverse Community

Dataverse Facts

Dataverse Network

- **Fact**: There are at least 137 Dataverse installations throughout the world
- **Fact**: These installations host hundreds of thousands of datasets and share metadata about many more
- **Fact**: Data reusers download millions of datasets each year

Dataverse Community

- **Fact**: The Dataverse Community is a large network of creative people
- **Fact**: Members of the Dataverse Community create and share tools, integrations, metadata blocks

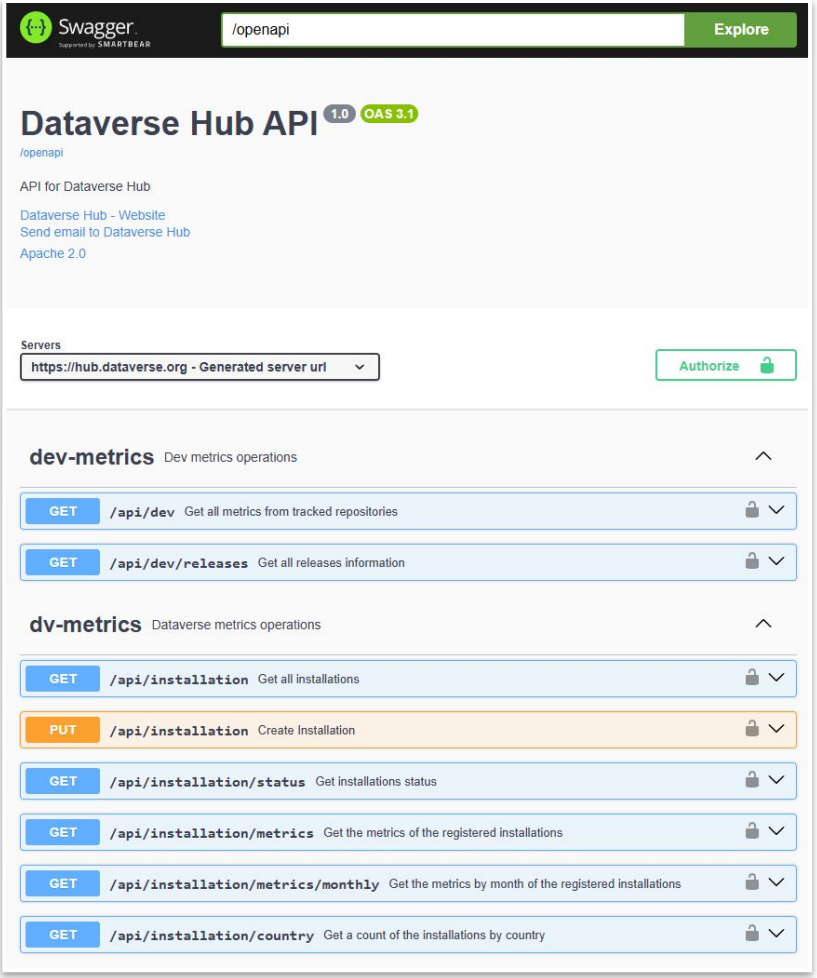

Goal: Empower the Community by providing a hub for metrics, tools, and more!

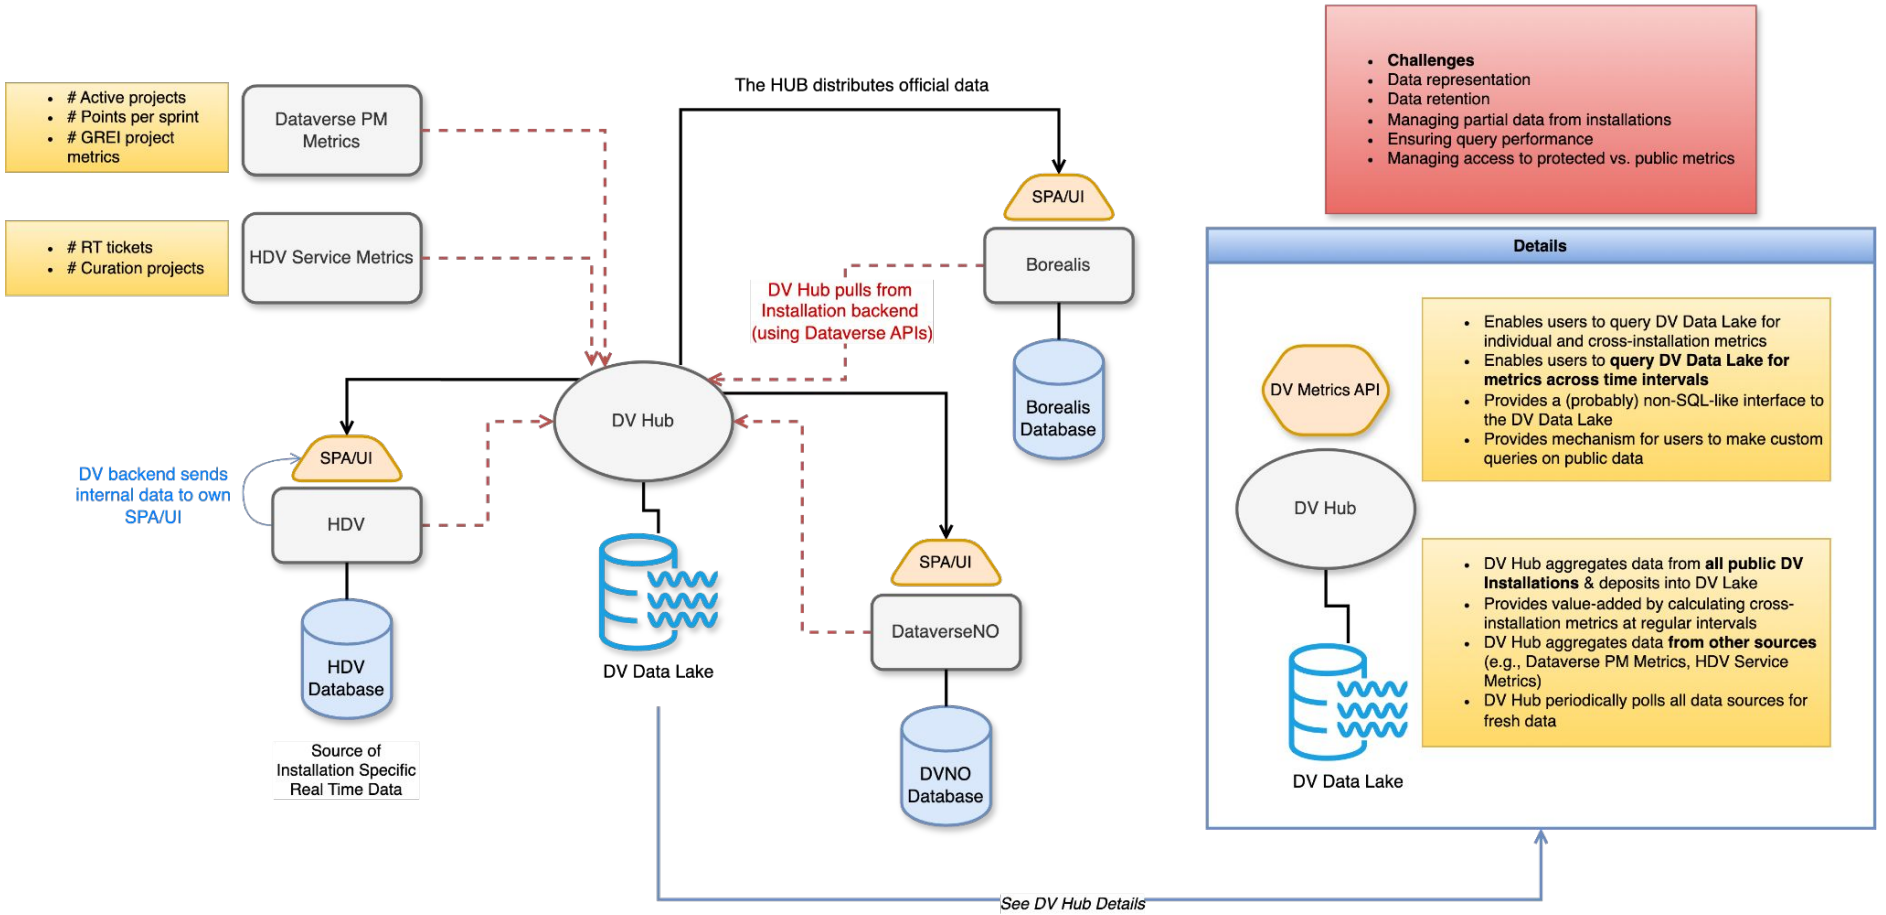

Photo by Hannah Busing on Unsplash

Dataverse Hub

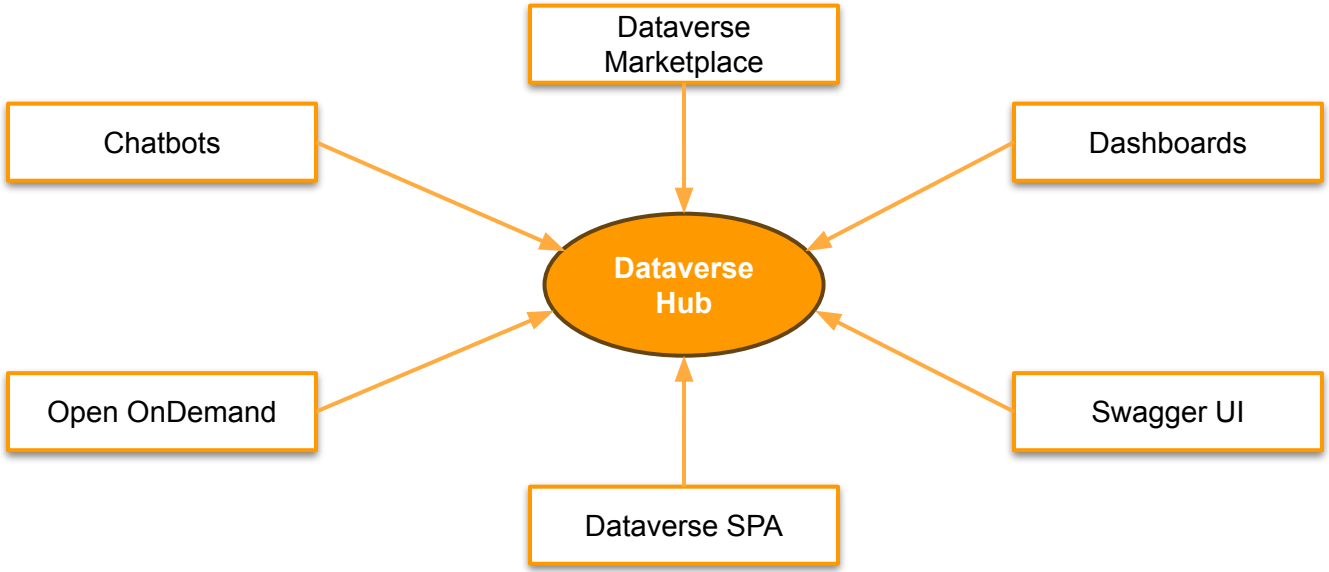

- Hub for all Dataverse Network metrics (and other services)
- Java server & database aggregates and serves metrics from all participating Dataverse installations (v.5+)
- One-stop-shop for up-to-date metrics about installations, datasets, downloads, files, and more
- REST API
- Uses OpenAPI, with a Swagger UI
- https://hub.dataverse.org
- GitHub repo: https://github.com/IQSS/dataverse-hub

Dataverse Hub Architecture

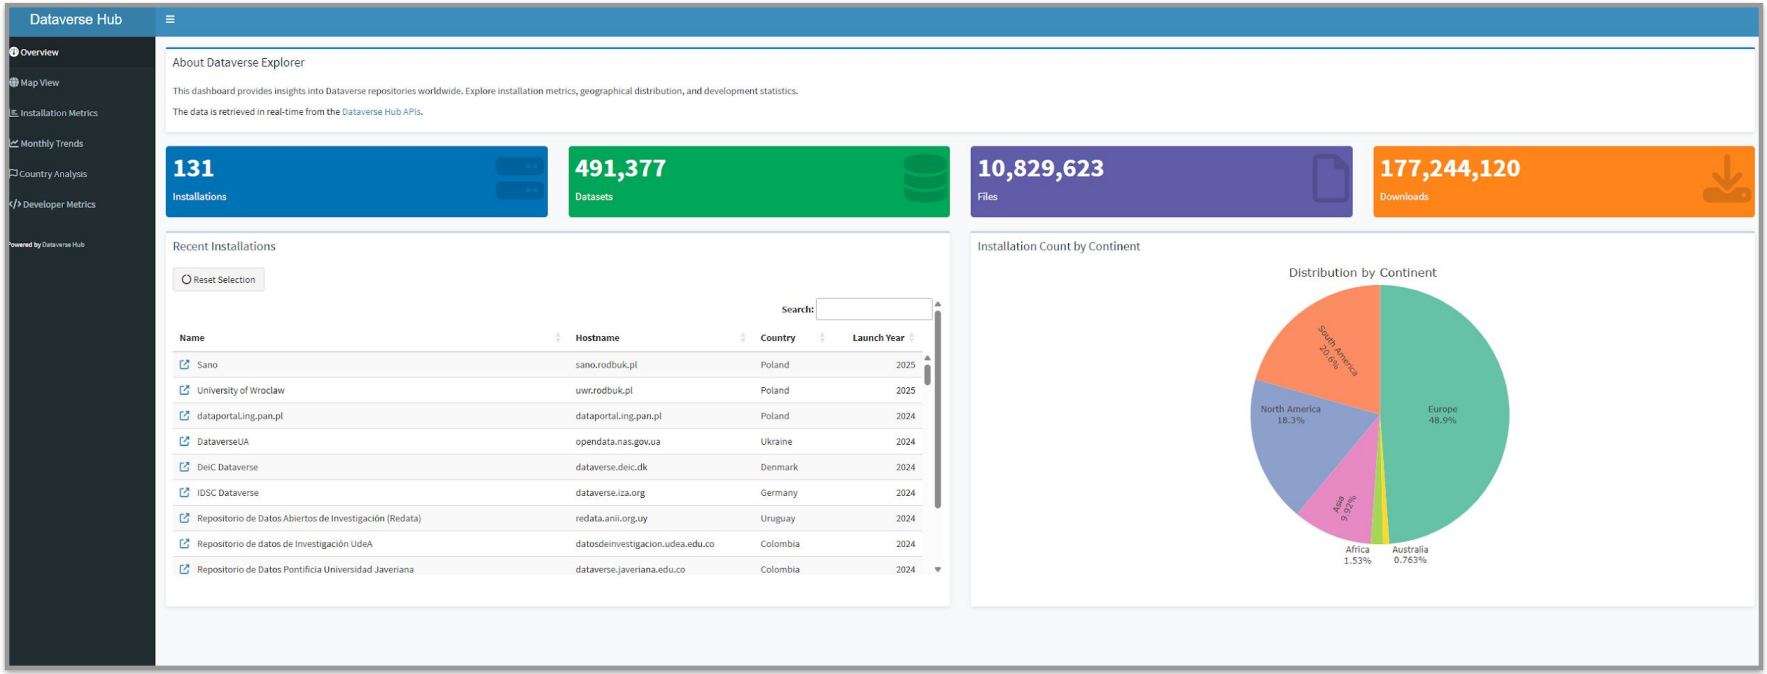

Empowering Apps

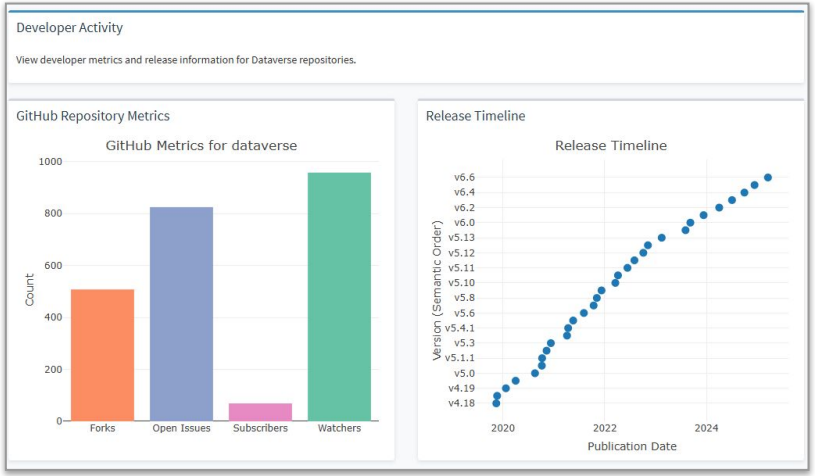

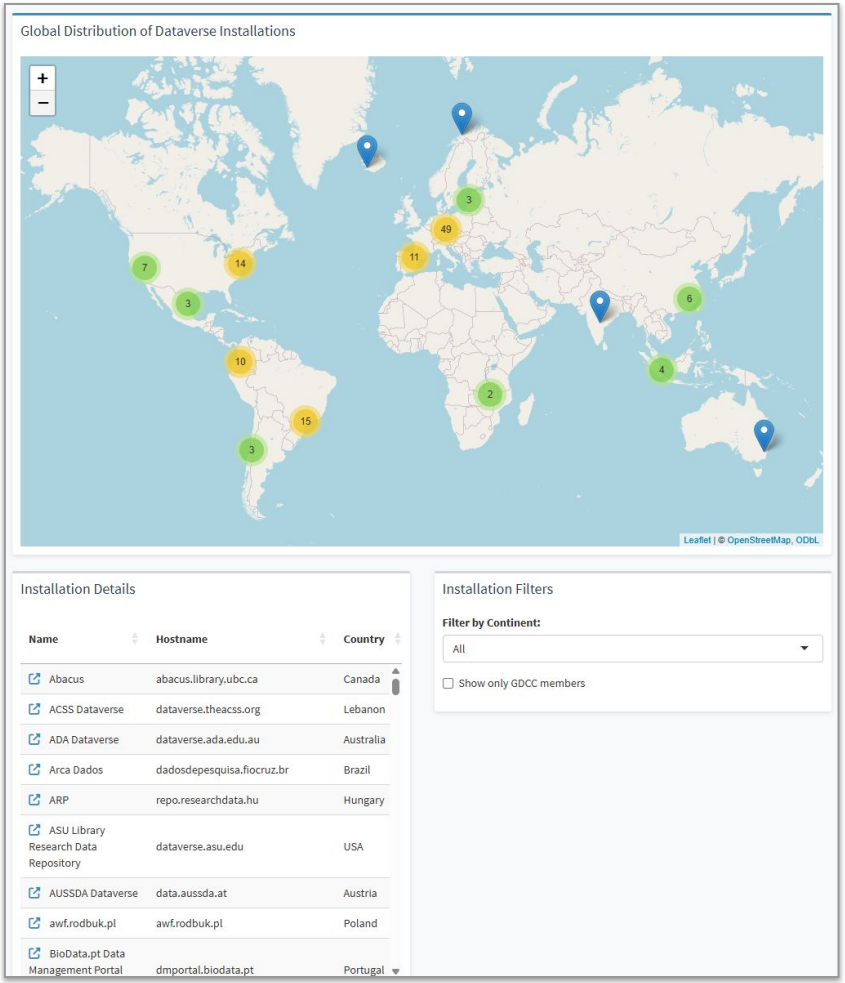

R Shiny Metrics Dashboard

https://askdataverse.shinyapps.io/dvhub

- R Shiny App built on the Dataverse Hub API
- Uses Shiny UI elements
- Easy to implement, little programming experience needed

Dataverse Marketplace

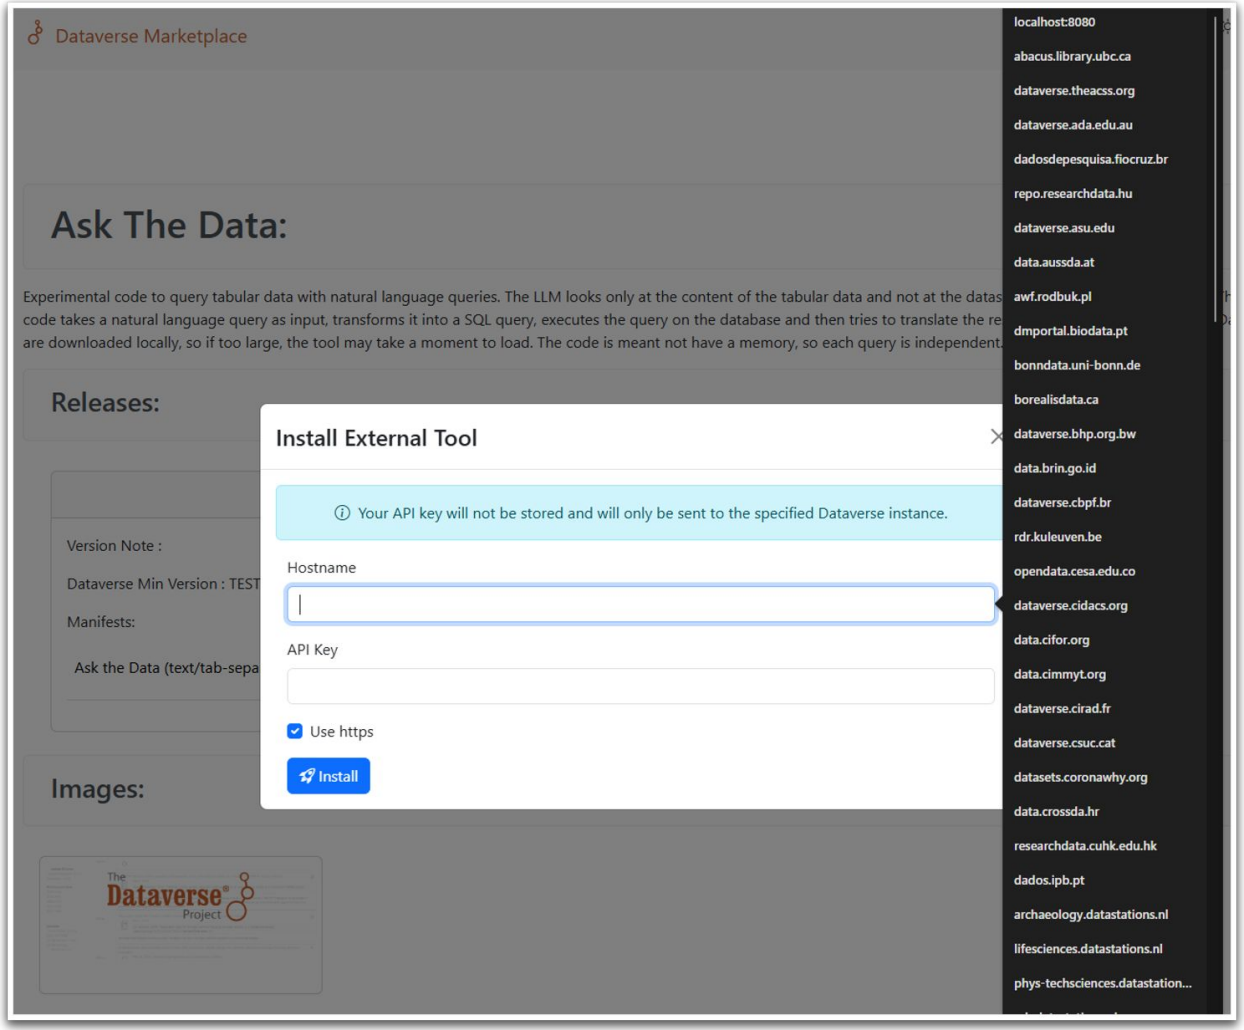

- Built on the Dataverse Metrics Hub
- Uses Java 23, Spring Boot, React, PostgreSQL, Docker, and OpenAPI
- Storefront for Dataverse external tools
- Easy way for Dataverse installation managers and developers to expand their installation's functionality with Community-contributed add-ons
- Planned: custom themes, language packs, metadata blocks, licenses, exporters, SPA integration

Dataverse Marketplace MVP

Focus on External Tools	Trusted Users Can Add Tools	Manifest Metadata Handling
● Vast majority of external tools currently in production ● Simpler, no need to install any apps, just register the manifest file	● Versions are non specific, so can be used in a variety of manners: ● Versions 1, 2, 3, etc. ● One version using older style query parameters, another using the newer signed URLs ● Different version for different tool type (e.g. Data Explorer)	● Only one version required for multiple content types, but creates individual manifest for each content type to support style of manifest files ● This allow for future improvements / changes to manifest structure, i.e. Tool owners won't need to edit the marketplace to support
