Research Data in Transition: Organization, Challenges, and Emerging Professional Roles in the Era of Digital Repositories

IBICT, Brasília, September 15th, 2025

Sonia Maria Barbosa

Associate Director, Dataverse Support, Data Curation, and The Murray Archive

IQSS, Harvard University

Agenda

1. The importance of data organization, cleaning, and preparation for storage, preservation, and reuse

2. The main challenges researchers face in the data management lifecycle

3. Emerging professional opportunities in providing technical support, curation, and guidance for the use of data repositories

And particularly, the new professional profiles that are expected to emerge with the growing integration of Artificial Intelligence into the public domain, impacting how research data is organized, preserved, and accessed

The Importance of Data Organization, Cleaning, and Preparation

Planning & Collection

Documentation & Metadata

Cleaning & Quality Control

- **Organization**
  - Ensures consistency & structure
  - Improves discoverability & interoperability
- **Cleaning**
  - Increases accuracy & reliability
  - Removes errors, duplicates, inconsistencies
- **Preparation**
  - Adds documentation & metadata
  - Converts to sustainable formats (CSV, JSON, TIFF)
- **For Storage, Preservation, & Reuse**
  - Efficient storage & reduced redundancy
  - Long-term accessibility & integrity
  - Enables reproducibility & FAIR data

- If data are organized, cleaned, and documented = this work becomes easier for the repository and for the data user.

- Curators spend an extraordinary amount of time trying to determine if a deposit into a data repository is complete, when documentation is insufficient.

- Is your data not organized, cleaned, documented? Don't expect too many re-users.

  Don't be the person that adds to the invisible workload of data curators and data users

Title	Colorado Adoption Project, 1976-2002
Other Identifier	00913
Author	Plomin, Robert DeFries, John C. Fulker, David W.
Description	The Colorado Adoption Project (CAP), begun in 1976, is a longitudinal adoption study that examines genetic and environmental influence on behavioral development. Investigators employed a "full" adoption design by collecting data from the adoptive and biological parents, the adoptees and matched control parents and their children. The entire data set includes measures from predominantly white parents, siblings, and focal children (probands) spanning over a thirty-year period, and now Dataverse has acquired additional NICHD funded data up to the year 30 assessment of the project. Children were given standardized tests of mental and motor development, communication, personality, and temperament. Additional assessments included home observations, information on the physical environment, demographics, the child's birth and the Family Environment Scale. These measures were completed in the homes of the families when the children were 1, 2, 3 and 4 years old. At ages 5 and 6, the parents were surveyed by mail and phone about temperament, health, development of their child and again completed the Family Environment Scale. Cognitive assessments were given at home or in the lab at assessment years 1, 2, 3, 4, 7, 12, 16, 21 and 30. Telephone cognitive assessments were givens at ages 9, 10, and 14 . Survey and questionnaire data were collected approximately annually between ages 9 to 16, and again at ages 21 and 30. The Dataverse holdings include data from the first 16 yearly waves of the study (ages 1-16), as well as data from the year 21 and 30 waves of the study. Proband and sibling data are included in all waves. Parent data and coded video data from the first 3 waves of the study (i.e., years 1, 2, and 3) are also available.

Sensitive Social Science Data in a Digital Repository

- Management of anonymized sensitive data
- Utilization of repository features:
  - Restricted data
  - File level metadata: tags, proper file naming conventions, detailed file descriptions
- Repository Data Management and Sharing Guidance Documentation

Examples of Data Organization, Cleaning, and Preparation

- Documenting data processing and cleaning (by PI or data curator/archivist)
-
- Documenting acquisition and archiving processes
-
- Documenting discrepancies between the data and documentation
-
- Confirming reproducibility verification

Examples of Data Organization, Cleaning, and Preparation

Phelps, E. & Zucconi, T., *Longitudinal Study of the Harvard/Radcliffe Class of 1996*

The Murray Research Center originally received one SPSS system file MERGED.SAV by email from Erin Phelps. The data contained variable labels and value labels. This data came with a digital codebook. This documentation provides an overview of the changes that were made to the computer data during processing.

Information on Identification Variables

The case identification number (ID) is the first variable in the file. The second variable is labeled COHORT_4. This variable describes both the gender (Female/Male) and the concentration choice (Science/Humanities) of the respondents.

Information on Waves of Data Collection

This data set contains two waves of data. The first wave was collected around May 1993 and the second around March 1995. Variables beginning with T1 correspond to the first wave of data (T1BAQ1-T1HRQ15). Variables that begin with T2 are from the second wave (T2BAQ1A-T2HRQ13). Variables T1BAQ3AR-T1HSQ2DR are recoded variables from the first wave of data. The data contain 66 cases and 372 variables across the two waves.

Measures

The Murray Center has archived all of the measures used for this study. Each of the 66 participants completed the Wave 1 questionnaire. There were 55 respondents (11 missing) to the Wave 2 questionnaire (one Wave 1 participant was deceased). Interviews were obtained with 47 participants during Wave 1 and 51 during Wave 2.

Out of Range Values

The following are variables with out-of-range value(s):

Variable T2BAQ13C: Job 3 Description.

Reproducibility Verification in Computationally Resuble data and Data Trust

Must provide sufficient materials to allow verification of all analytic results reported

AJPS AMERICAN JOURNAL of POLITICAL SCIENCE

HOME ARTICLES & NOTES REVIEWS MANUSCRIPTS DATA INTEGRITY ABOUT AJPS

AJPS Verification Policy

The corresponding author of a manuscript that is accepted for publication in the *American Journal of Political Science* must provide materials that are sufficient to enable interested researchers to verify all of the analytic results that are reported in the text and supporting materials. The document titled "*American Journal of Political Science* Guidelines for Preparing Verification Files"* provides useful information about what information is needed and how it should be organized. All verification files must be stored in a Dataset within the *AJPS* Dataverse, on the Harvard Dataverse Network. Note that authors also can make their verification files available elsewhere (e.g., their personal website, other data repositories, etc.) as long as all of the necessary files are included in the Dataset on the *AJPS* Dataverse.

The corresponding author should prepare and upload verification materials to the *AJPS*Dataverse before submitting the final draft of the accepted manuscript. The "*American Journal of Political Science* Quick Reference for Uploading Replication Files"* provides information about creating a Dataset on the *AJPS* Dataverse and depositing materials into it. The "*American Journal of Political Science* Quantitative Data Verification Checklist" and "*American Journal of Political Science* Qualitative Data Verification Checklist" are designed to help authors ensure that they have provided all necessary files.

When the final draft of the manuscript is submitted, the materials will be verified to confirm that they do, in fact, reproduce the analytic results reported in the article. Publication in the *American Journal of Political Science* is contingent upon provision of complete verification materials and successful verification of their content.

Examples of Data Organization, Cleaning, and Preparation

The Main Challenges Researchers Face in the Data Management Lifecycle

Planning & Collection

- Anticipating future storage, formats, costs
- Often underestimated, leading to loss

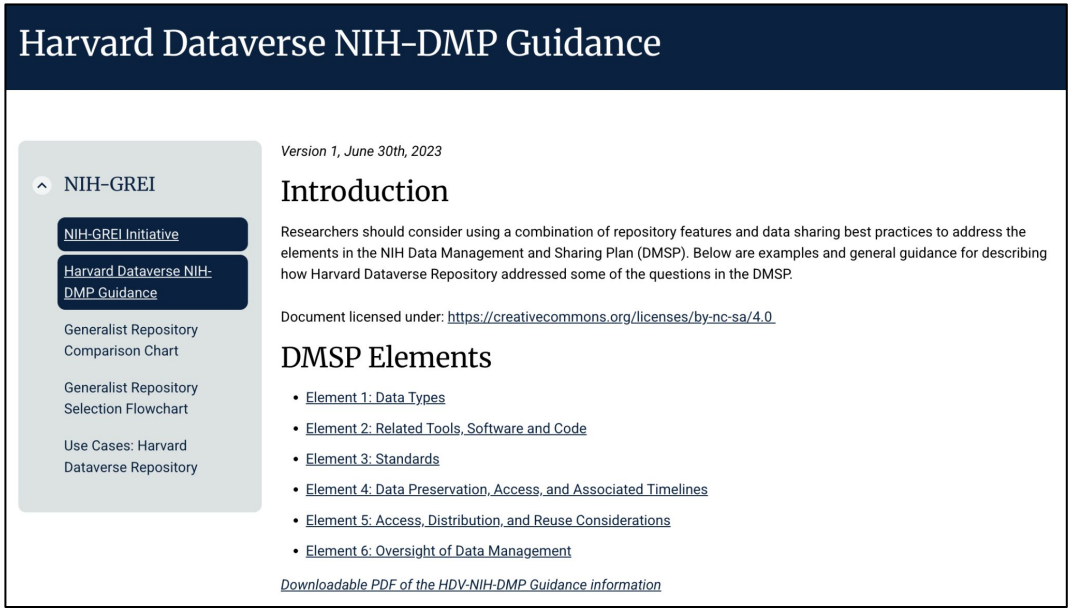

Documentation & Metadata

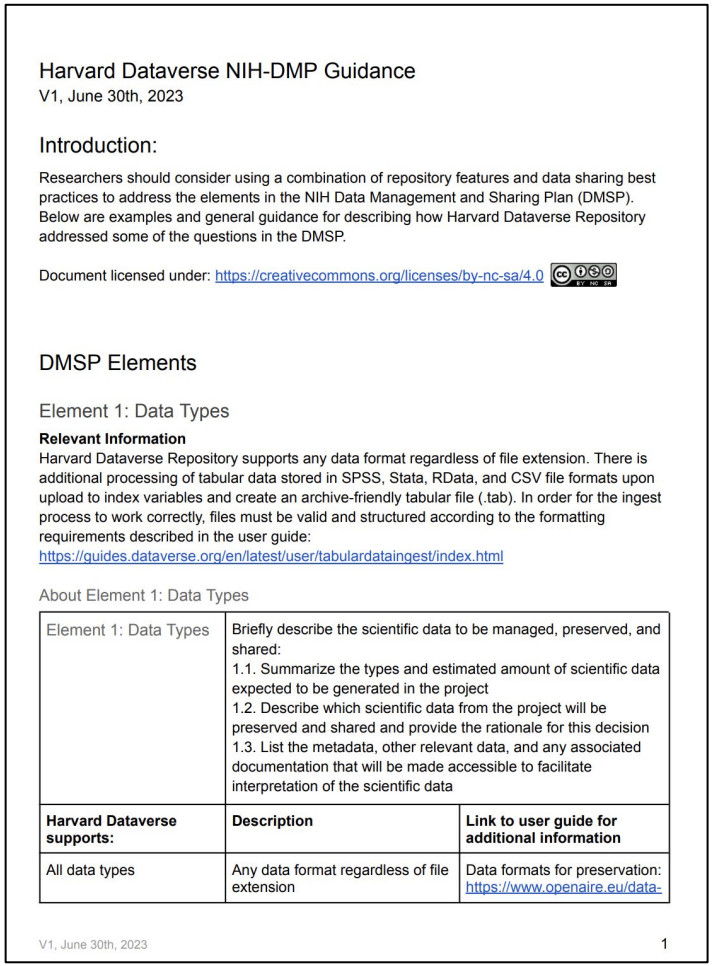

- Insufficient context/provenance
- Data becomes meaningless without it

Cleaning & Quality Control

- Time-intensive, error detection
- Low-quality data undermines reproducibility

Harvard Dataverse NIH-DMP Guidance
V1, June 30th, 2023

Introduction:

Researchers should consider using a combination of repository features and data sharing best practices to address the elements in the NIH Data Management and Sharing Plan (DMSP). Below are examples and general guidance for describing how Harvard Dataverse Repository addressed some of the questions in the DMSP.

Document licensed under: https://creativecommons.org/licenses/by-nc-sa/4.0

DMSP Elements

Element 1: Data Types

Relevant Information
Harvard Dataverse Repository supports any data format regardless of file extension. There is additional processing of tabular data stored in SPSS, Stata, RData, and CSV file formats upon upload to index variables and create an archive-friendly tabular file (.tab). In order for the ingest process to work correctly, files must be valid and structured according to the formatting requirements described in the user guide:
https://guides.dataverse.org/en/latest/user/tabulardataingest/index.html

About Element 1: Data Types

Element 1: Data Types	Briefly describe the scientific data to be managed, preserved, and shared: 1.1. Summarize the types and estimated amount of scientific data expected to be generated in the project 1.2. Describe which scientific data from the project will be preserved and shared and provide the rationale for this decision 1.3. List the metadata, other relevant data, and any associated documentation that will be made accessible to facilitate interpretation of the scientific data	
Harvard Dataverse supports:	**Description**	**Link to user guide for additional information**
All data types	Any data format regardless of file extension	Data formats for preservation: https://www.openaire.eu/data-

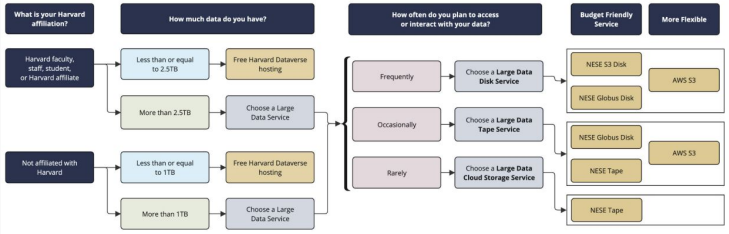

Dataverse NIH Data Management Plan Guidance Documentation

Planning for Large Data Support

- Cost per storage type
- Length of storage (min 6 years)
- Download considerations (Immediate download = Increased cost)
- Data packaging requirements
- No API support at this time

Figure 2

Storage Costs

- The figures below are *estimates for storage only*. For upload and download costs, see Raw Storage Cost Comparisons.
- Your actual costs *will be higher* because the Dataverse Team must provision and manage these storage options on your behalf.

Service Offering	Access	Storage Cost
Large Data Basic Service: NESE Tape	Globus	$ 11 / TB / Year
Large Data Basic Service: Globus NESE Disk	Globus	$ 22 / TB / Year
Large Data On-Demand Service: S3 NESE Disk*	S3/HTTP	$ 22 / TB / Year
Large Data Cold Storage: NESE Tape	Globus	$ 11 / TB / Year
Large Data On-Demand Service: AWS S3	S3/HTTP	$ 276 / TB / Year

* Our S3 NESE Disk offering is forthcoming

Raw Storage Cost Comparisons

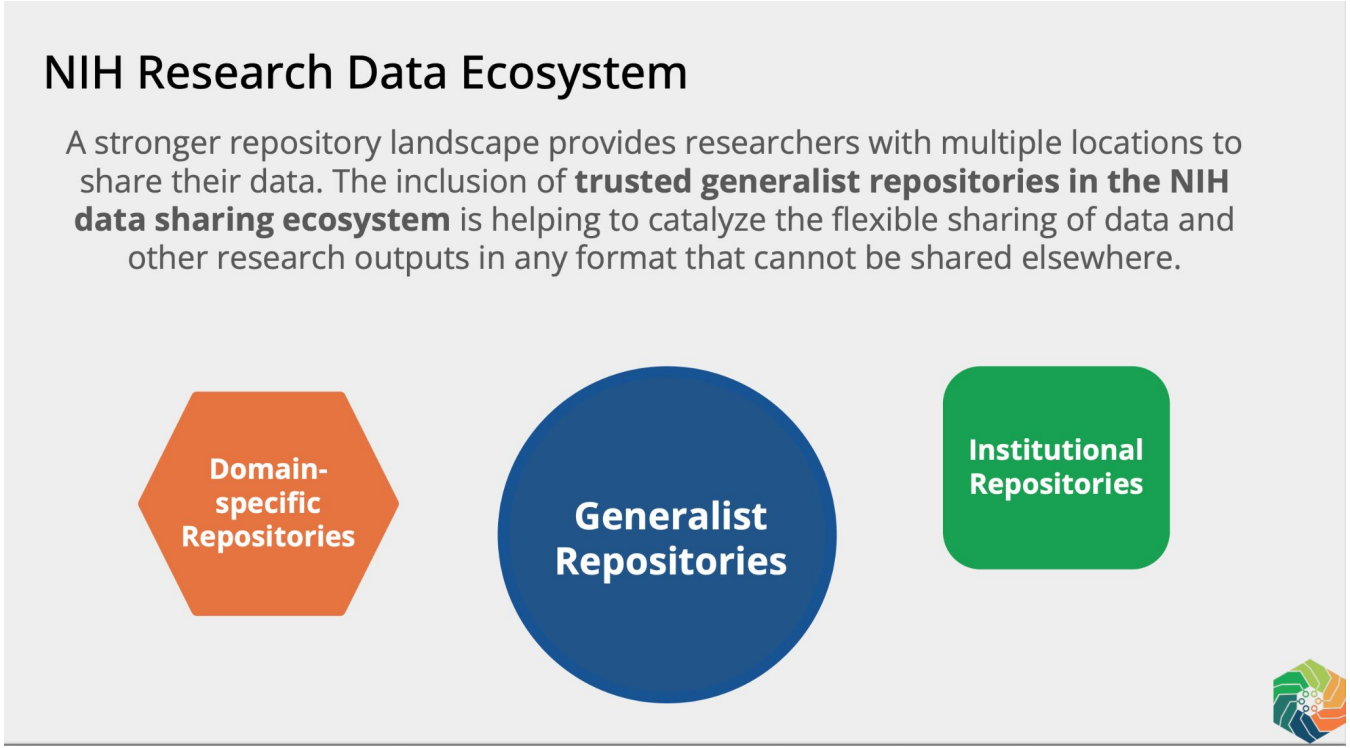

Storage Option	TB / Year	Uploads	Downloads
Large Data Basic Service: NESE Tape	$11	$0	$0
Large Data Basic Service: Globus NESE Disk	$22	$0	$0
Large Data On-Demand Service: S3 NESE Disk*	$22	$0	$0
Large Data Cold Storage: NESE Tape	$11	$0	$0

File Access, Size, and File Count Limitations

	NESE Tape	Globus NESE Disk	S3 NESE Disk*	AWS S3

File Size				
Minimum	100 MB	-	-	-
Maximum	-	2 TB	1 TB	5 TB
Preferred	1 GB - 1 TB	-	-	-
File Count				
Ideal	50 files per dataset	50 files per dataset		
Maximum	100 per dataset	100 per dataset	*	-

*Our S3 NESE Disk offering is forthcoming; maximum file count for this service is not known at this time.

Emerging professional opportunities in providing technical support, curation, and guidance for the use of data repositories

GREI Objectives

The Dataverse Project · DRYAD · figshare · OSF · MENDELEY DATA · Vivli · zenodo

- Align with Desirable Characteristics for Data Repositories
- Implement browse & search for NIH funded data
- Develop consistent metadata models
- Conduct limited QA/QC of the NIH funded data
- Enable connectivity of digital objects
- Use case support, including cross repository use cases
- Implement open metrics
- Develop educational materials
- Conduct broad outreach
- Commit to “Co-opetition”

Usage Patterns Across Repositories*

(1) An increasing number of researchers naming the repository in Data Management & Sharing Plans submitted to NIH

(2) Repository usage varies by discipline - highest for disciplines where data sharing is a well-established or emerging practice

(3) Ability to restrict access to datasets is a recurring need

(4) Growing interest in sharing large datasets/large files

(5) Most data submitted has been for small research projects or as mandated by publishers, but change is expected as funding cycles under the 2023 DMS Policy and others complete

* As reported by the institutional representatives:

Value of Generalist Repositories*

(1) Improved data discovery supports potential data reuse

(2) Demonstrable data sharing policy compliance

(3) Ease of impact tracking

(4) Support for researchers/users to improve data and metadata quality

(5) Accessible, easy-to-use, low-barrier platform facilitates data sharing

(6) Flexible privacy controls work across different project types and research phases

(7) Integration with related tools allows users to easily connect existing workflows

(8) Platform maintenance is taken care of, allowing institution staff to focus on curation

https://zenodo.org/records/15881336

Domain	GREI Achievements	Future Work
Metadata Standards & Interoperability	Finalized a core metadata recommendation to enhance data discoverability and interoperability; Integrated ROR for funder and affiliation.	Integrate PIDs for datasets, researchers, and institutions to ensure robust linkage within the research ecosystem.
Common Metrics	Adopted MDC principles for harmonized metrics capturing data usage, citation, and impact.	Fully implement MDC metrics across all participating repositories, providing actionable insights into data reuse and reach.
Catalog of Use Cases	Developed a cross-disciplinary catalog of use cases demonstrating successful data sharing across various fields.	Expand catalog to include AI-focused and complex data use cases, as well as data reuse.
Community Engagement and Capacity Building	Produced webinars, workshops, and training resources (flowchart, comparison chart, data deposit guide, data management and sharing plan guide) to support researchers in data sharing practices.	Create targeted resources for early-career researchers and anyone not adequately experienced in data management best practices, and leverage partnerships with professional societies and other organizations for broader outreach.

GREI Use Cases to Improve Data Sharing in Generalist Repositories

GREI Use Cases

- An NIH-funded researcher seeking to share research data
- A researcher who wants to find relevant research data.
- An institution intending to report on all datasets from its organization
- A funder from a specific NIH institute, or in general, who wants to locate their funded data sets
- An institution looking to use the Harvard Dataverse Repository as its infrastructure for an institutional data repository
- A researcher wishing to share a large dataset

As a researcher, I want to use the Harvard Dataverse Repository to share Big Data whose volume, variety, velocity, or veracity requires special infrastructure functionality or handling

This use case highlights ways generalist repositories support Big Data via specialized functionality for large and complex dataset

support@dataverse.harvard.edu

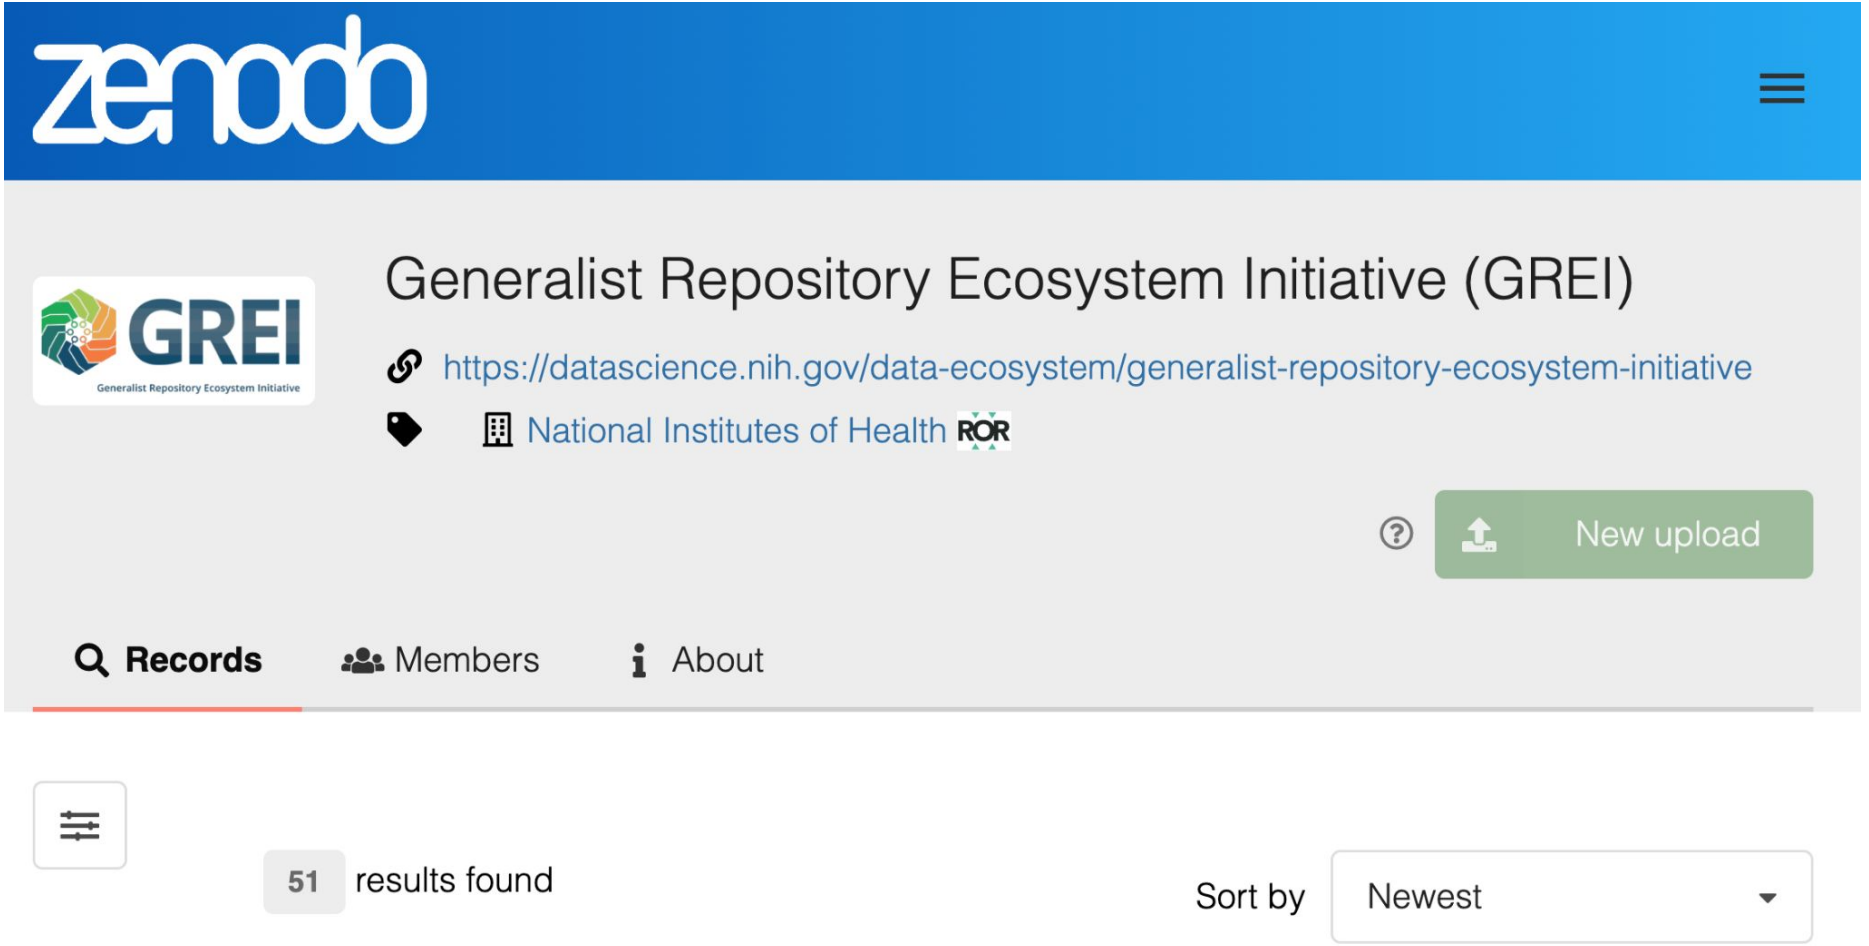

Background:

Researchers at Massachusetts Institute of Technology (MIT), the Technical University of Munich (TUM), BETA CAE Systems, and BikeCAD collaborated on a project producing four datasets, each with over 8,000 files each, totalling 16 T of data. They packaged the individual files in zip files to support easier downloading for data reusers. Then, they uploaded them to Harvard Dataverse Repository. The project is completed, the datasets will not be versioned, and the collection will not grow.

The data files themselves are stored on tape resources at the Northeast Storage Exchange (NESE). Datasets are downloaded using the Globus protocol and app.

Screenshots of the file landing page for one of the project's datasets. Note the zip files available for download and the icon indicating the files are stored on NESE tape resources.

GREI Use Cases are supported by the National Institutes of Health (NIH) Office of Data Science Strategy/ Office of the NIH Director pursuant to OTA-21-009, "Generalist Repository Ecosystem Initiative (GREI)". New professional profiles that are expected to emerge with the growing integration of Artificial Intelligence into the public domain, impacting how research data is organized, preserved, and accessed

Dataverse and AI

- Investigations & development began in 2023 at Harvard and across the Dataverse Community
- Emphasis on generative AI, LLM, RAG, human-in-the-loop
- Many resources, tools, and projects are in production or underway
- **AI Promise**: Improve data findability; metadata quality; data reusability; tool development & integration; support data exploration & curation

Photo by Justin Ha on Unsplash

Who Benefits from Dataverse AI?

- Data curators
- Data depositors
- Data seekers
- Dataverse repository users
- Data reusers
- Metadata harvesters
- Repository managers
- Repository strategists
- Software developers
- System integrators
