Executive Summary

This report presents highlights of the annual progress made by the Dataverse Project team towards key ongoing and project activities. It describes work in three categories: Dataverse Operations (recurring work), Services, and Projects.

During fiscal year 2024-2025, the Dataverse team reported giving 52 talks, trainings, and workshops; developing two new services; participating in seven funded project initiatives; and being involved in 14 projects overall, involving three partnerships with the IQSS Sids team, the IQSS RapidPeer team, and the School of Engineering and Sciences (SEAS) Open DP project. Additionally, the team released four new Dataverse versions: 6.3, 6.4, 6.5, and 6.6.

Activity Engagement Intensity

The table below shows Dataverse Project involvement across our three categories of work. The *Updated* column indicates the frequency of updates for the activity during the entire FY or throughout its start/end period. This number indicates an activity's level of intensity or investment; 100% indicates monthly progress. Twelve of our 19 tracked activities had 100% engagement during FY25.

Starred activities indicate collaborations between the Dataverse Project team members and other groups or organizations. Eight activities received external funding.

Activity	External Funding	Updated	FY25 Status
Dataverse Operations (recurring)			
Team Meetings and Events: Dataverse Project, FY25	N/A	81.82%	Ongoing
Dataverse Sprints and Releases, FY25	N/A	100.00%	Ongoing
Dataverse Community, FY25	N/A	100.00%	Ongoing
Services (open-ended)			
Establish Dataverse Project Metrics Service Improve Adoption & Retention Improve Usability	No	91.67%	Ongoing
Harvard Dataverse Repository Large Data Services Improve Customer Acquisition Support New Use Cases	Yes	100.00%	Ongoing
Projects (time-bound)			
Analyze and Prioritize Dataverse Backlog Maintain Performance Technical Debt & Maintenance	No	100.00%	In Progress
Bertarelli Foundation Large Data Project	Yes	66.67%	In Progress
Dataverse Marketplace Improve Adoption & Retention Strengthen Customer Support	No	81.82%	In Progress
Design and Implement External Search Innovation & Experimentation Innovation	No	54.55%	In Progress
Develop a Repository and a Dataset Migration Tool and Service Improve Adoption & Retention Data Acquisition	No	66.67%	In Progress

Activity	External Funding	Updated	FY25 Status
*DP Wizard - Partner: SEAS Open DP Innovation & Experimentation Innovation	Yes	100.00%	In Progress
*Establish Harvard Pre-Peer Review Program (PPR) Support - Partner: IQSS RapidPeer team Improve Customer Acquisition Support New Use Cases	No	100.00%	Completed
Google Data Commons Improve Adoption & Retention Improve Usability	No	83.33%	Not Started
Kaggle/Croissant Improve Adoption & Retention Expand Reach	No	100.00%	In Progress
NIH GREI - Generalist Repository Ecosystem Initiative, Year 3 Improve Customer Acquisition Support New Use Cases	Yes	100.00%	Completed
NIH GREI - Generalist Repository Ecosystem Initiative, Year 4 Improve Customer Acquisition Support New Use Cases	Yes	100.00%	In Progress
NIH CAFE Improve Customer Acquisition Support New Use Cases	Yes	100.00%	In Progress
*Open OnDemand (OOD) and Dataverse Integration Proof-of-Concept - Partner: IQSS Sid Improve Customer Acquisition Support New Use Cases	Yes	100.00%	In Progress
Pilot Large Data Support Service	Yes	100.00%	Completed

Dataverse Project and Activity Summaries

This section summarizes Dataverse reports highlighting key activities, projects, and services for the fiscal year 2024-2025. These summaries were created with input from the HUIT AI Sandbox using OpenAI GPT-4.1 🤖.

Team Meetings and Events

Tracking for the Dataverse Project team meetings and events. Does not include the Dataverse Community Meeting, 2025.

The Dataverse team regularly meets throughout the year to share updates, coordinate activities, and team build.

- Nine (9) monthly team meetings were held in FY25, and one (1)retrospective. No meeting was held in June 2025, as the team attended the Dataverse Community Meeting 2025, which was held at the University of North Carolina at Chapel Hill.
- Participants: Dataverse Project staff
- Status: Ongoing
- Tracking Issue: https://github.com/IQSS/dataverse-pm/issues/287

Team Conferences, Talks, Trainings, and Workshops

The Dataverse team regularly gives talks, trainings, holds workshops, and attends and presents at conferences.

- This year, the Dataverse Project team reported giving 52 talks, trainings, and workshops.
- Participants: Dataverse Project staff
- Status: Ongoing
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/298

Dataverse Sprints and Releases

Throughout the year, Dataverse development is conducted in two-week sprints; releases are made four times per year.

- This fiscal year, the team conducted 26 sprints and released four Dataverse versions: Release 6.3, 6.4, 6.5, and 6.6.
- Participants: Dataverse Project development staff
- Status: Ongoing

- Tracking Issue: https://github.com/IQSS/dataverse-pm/issues/228

Dataverse Community

In 2025, there were 137 known Dataverse installations across more than 30 countries worldwide. This vibrant Dataverse Community participates in conversations in the Google Groups mailing list, Dataverse Slack channel, and across a variety of Dataverse Zulip channels.

- The Dataverse Community experienced remarkable growth and engagement over the past fiscal year, marked by numerous new installations worldwide, active community calls, the release of multiple Dataverse versions, and vibrant contributions from members and working groups. The collaborative spirit continued through a diverse schedule of talks, working group activities, and community innovations, fostering an international and interdisciplinary network dedicated to research data sharing and repository excellence. Highlight included:
    - Over a dozen new Dataverse installations have been launched globally, including major institutions and countries that are hosting their first Dataverse.
    - Multiple new Dataverse releases (6.3 through 6.7), with ongoing improvements, previews, and expanded interoperability.
    - Frequent, well-attended community calls and webinars featuring technical demos, innovative projects, and integration showcases.
    - Active development and community contributions, including the processing of the GitHub backlog, new features (e.g., metadata exporters, MCP support), and major tool upgrades.
    - Working groups (e.g., pyDataverse, Containerization, Sensitive Data, Large Data Support, Documentation) met regularly, published reports, launched new websites, and celebrated notable achievements such as CoreTrustSeal certifications.
- Participants: Dataverse Community members and project staff
- Status: Ongoing
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/280

Dataverse Community Meeting, 2025

Each year, the Dataverse Project holds a multi-day conference open to all members of the Dataverse Community and other interested participants. In 2025, the Community Meeting was held at the University of North Carolina, Chapel Hill.

- 57 total presentations/events

- 104 attendees (onsite and online - online could have been an entire community/group per registrant)
- Participants: Dataverse Community members and project staff
- Status: Completed

Services

Dataverse Metrics Hub

The Dataverse Metrics Hub is intended to centralize all Dataverse and Harvard Dataverse-related metrics.

- Work on the Dataverse Metrics Hub began in June 2024. Throughout the fiscal year, the project made substantial progress in team organization, conceptual design, and technical implementation activities. J.P. presented the Metrics Hub at the Dataverse Community Meeting, 2025: DV Metrics Hub. Ongoing contributions, utilizing issue-focused workflows and community input, are establishing a solid foundation for future development and broader adoption. Work accomplishments include:
    - **Redesign and Documentation**. Established a new design philosophy, deprecated older proposals, and ensured all new plans and features are documented in a centralized, living design document, complemented by 100% OpenAPI-compliant documentation.
    - **Successful Launch of Early Prototype**. Developed and launched an early public version of the Dataverse Metrics Hub at hub.dataverse.org, featuring core backend endpoints and a Shiny app-based frontend prototype.
    - **Scheduled Data Collection and Metrics Reporting**: Implemented automated scheduled jobs to gather up-to-date metrics from Dataverse installations and repositories, including the addition of performance-optimized data importers.
    - **Performance and Scalability Improvements**. Optimized API endpoint performance with caching mechanisms (reducing some payloads by over 70%), adopted Polars for fast data processing, and refactored endpoints for flexibility and efficiency.
    - **Collaborative Development and Issue Tracking**. Utilized GitHub issues and pull requests to drive project progress, merging key features—such as endpoint caching, documentation updates, and logging improvements—while incorporating stakeholder feedback and bug reports.
- Participants: JP Tosca (lead), Dataverse development team
- Status: In Progress

- Tracking Issue: https://github.com/IQSS/dataverse-pm/issues/271

Harvard Dataverse Large Data Services

Harvard Dataverse Repository provides affordable, large research data stewardship and archiving services to Harvard affiliates and non-Harvard researchers and groups.
These fee-based services complement our existing Curation and Data Management Services, which include free support for research data collections up to 1.0TB for non-Harvard researchers and groups and 2.5TB for Harvard affiliates.

- From June 2024 to June 2025, the Harvard Dataverse Repository Large Data Service made substantial progress in service design, technical development, and project support. Over this period, the team established foundational documentation and intake workflows, piloted technical enhancements for large file transfers (notably with Globus), expanded communication and training efforts, and developed support for an active and growing portfolio of large-scale data collections. Accomplishments this fiscal year include:
    - **Comprehensive Service Documentation and Intake Process**. Completed and published detailed internal and external service descriptions, finalized intake forms, and updated the Harvard Dataverse Support website.
    - **Advancements in Technical Infrastructure**. Deployed multiple improvements to Globus transfer mechanisms, including experimental async frameworks and optimizations for both uploads and downloads, improving large data handling.
    - **Growth in Active Projects and Client Base**. Onboarded several significant projects such as CAFE Environment and Health Data, DRIVERNET, OMAMA, and began supporting new academic and research partners.
    - **Enhanced Project Tracking and Communication**. Launched a dedicated GitHub repository and project dashboard to track all large data projects, and held presentations/webinars to engage the community and stakeholders.
    - **Increased Service Demand and Inquiries**. Handled over ten new inquiries in Spring 2025 alone, with total data requests exceeding 2.7TB in June 2025, reflecting the growing recognition and demand for Large Data Services.
- Participants: Leonid Andreev, Sonia Barbosa, Ceilyn Boyd
- Status: Ongoing
- Tracking Issue: https://github.com/IQSS/dataverse-pm/issues/268

Projects

NIH Generalist Repository Ecosystem Initiative (GREI) Year 3

The long-term vision for GREI is to develop collaborative approaches for data management and sharing through the inclusion of the generalist repositories in the NIH data ecosystem. GREI also aims to enhance the search and discovery of NIH-funded data in generalist repositories. GREI's mission is twofold. The primary mission is to establish a common set of cohesive and consistent capabilities, services, metrics, and social infrastructure across various generalist repositories. Secondarily, GREI will raise general awareness and help researchers to adopt FAIR principles to better share and reuse data.

In fiscal year 2024-2025, the Dataverse team completed work for Year 3 of the Generalist Repository Ecosystem Initiative (GREI) project, which ran from March 2024 to February 2025. A comprehensive report for internal audiences is available here: GREI Year 3 Annual Summary. Access to Year 3 updates for individual objectives and task groups is available via this tracking issue: https://github.com/IQSS/dataverse-pm/issues/124.

An overview of Year 3 work across the eight GREI objectives and related task groups is shown below. The table shows the approximate completeness degree for all objectives and task groups for GREI Year 3.

	Y3Q1	**Y3Q2**	**Y3Q3**	**Y3Q4**
Objective or Task Group	**% Complete**	**% Complete**	**% Complete**	**% Complete**
Objective				
GREI 1: Desirable Repository Characteristics	17%	22.2%	25%	95%
GREI 2: Consistent Metadata	27%	51.7%	54.8%	60%
GREI 3: Search and Browse	13%	23.6%	29%	32.9%
GREI 4: Analytics and Reporting	27%	25%*	25%	58.3%
GREI 5: Use Cases	18%	27.6%	38%	93.05%
GREI 6: Connect Digital Objects	3%	3%	9.7%	12.5%
GREI 7: QA/QC	16%	19%	26.19%	33.33%
GREI 8: Training, Communication, and Community Engagement	Ongoing	Ongoing	Ongoing	Ongoing
GREI: Dataverse Rearchitecture	Pending	32.83%	37.54%	47.41%

* Task groups were merged into Epic: GREI Planning and Execution Unit #332

Key GREI-funded accomplishments include the integration of Local Contexts' TK Labels with the Dataverse codebase and progress on the new Dataverse Single Page Application (SPA).

TK Labels Local Context Integration

In FY25, the Dataverse development and curation team made strides in the area of Indigenous data support, using Local Contexts' Traditional Knowledge Labels (see https://localcontexts.org/ and https://localcontexts.org/labels/traditional-knowledge-labels/). They formed a highly focused Working Group of interested parties, in collaboration with Local Contexts, and began implementing support for TKLabels, leveraging the Dataverse metadata block features. The TKLabels Working Group and Dataverse Community members have tested and provided feedback on the implementation and its documentation. The integration was deployed in the 6.7 Dataverse Release. This collaboration also includes an Integration partnership with The

Dataverse Software. This integration allows DV installations worldwide to connect with the Dataverse integration partnership and access notices and labels for their communities.

Dataverse Rearchitecture: Single Page Application

The Dataverse frontend team has made substantive progress in GREI Year 3 towards implementing and delivering 47.41% of the core Dataverse data storage, stewardship, and collection management functionality needed for the June 2025 release of the Single Page Application (SPA). They demoed the new SPA design and implementation (see: Dataverse SPA Development) at the Dataverse Community Meeting, 2024, in Texcoco, Mexico. They also developed the Collection Page, Create Collection Page, Dataset Page, and the Create Dataset and Edit Dataset Metadata Page; enhanced file uploading and made API improvements for email validation; implemented infinite scrolling, support for multiple dynamic fields; and made improvements to the account page, API token management, collection publishing, and the dataset and edit collection pages.

NIH Generalist Repository Ecosystem Initiative (GREI) Year 4

- Work is currently underway for GREI Year 4. Internal reports are produced on a monthly, quarterly, and annual basis. Please view public quarterly updates for all objectives via this tracking issue: https://github.com/IQSS/dataverse-pm/issues/388.
- Participants: Dataverse team
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/370

Analyze and Prioritize Dataverse Backlog

- e Analyze Backlog Project aimed to create comprehensive inventories of outstanding feature requests and bug reports, facilitate transparent prioritization, and systematically review issues to streamline the backlog, thereby improving project management. Accomplishments this fiscal year included:
    - Completed review of all feature requests by June 2025, reducing open items from 217 to zero.
    - Closed approximately 434 outdated or irrelevant issues, with community feedback guiding the reopening of specific issues.
    - Developed inventories and new review tools, including a GitHub project and prioritization rubric, to enhance issue tracking and decision-making.

- Participants: Ceilyn Boyd (lead), Dataverse team
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/114
- Status: In Progress

Google Data Commons

This project is a collaboration with Google to share Harvard Dataverse datasets with the Google Data Commons.

- This fiscal year, the Google Data Commons project centered on developing tools and processes to transform Dataverse tables into the required format for Google Data Commons, utilizing AI and automation, and collaborating with partners to enhance data integration workflows. Key accomplishments include the following:
    - Designed and began developing a tool for specifying and automating data table transformations for Google Data Commons integration.
    - Leveraged the DDI data variable exporter from Dataverse to help automate datafile transformations.
    - Initiated and advanced training of large language models (LLMs) to recognize and process Dataverse tables.
    - Collaborated with Google developers to update conversion scripts and implement new data upload protocols.
    - Started migration of the development site to Docker cloud containers and tested with sample data.
- Participants: Stephen Kraffmiller
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/194

NIH Accelerating Climate and Health Research (CAFE)

The CAFE Research Coordinating Center (RCC) is a joint initiative by the Boston University School of Public Health and Harvard T.H. Chan School of Public Health. With the urgent need to address the health impacts of increasing extreme weather and natural disasters, the CAFE RCC brings together the climate and health research community to foster collaboration and accelerate scientific progress.

- This fiscal year, the NIH CAFE project advanced its mission to curate, integrate, and support the sharing of climate and health datasets funded by NIH. Over the year, the team focused on expanding data acquisition, refining curation processes, enhancing technical infrastructure, and increasing interoperability with external repositories, while also streamlining project management and outreach. Accomplishments included:

    - Expanded curated collections with new datasets, large data acquisitions (including SEDAC and CIESIN), and multiple data rescue initiatives.
        - Socioeconomic Data and Applications Center (SEDAC).

          CIESIN reached out to the Harvard Dataverse in June 2025 with 7TB of data that needed immediate rescue. In Collaboration with CAFE, this initiative was accepted for large data support. Working with one dedicated developer and the curation team, additional metadata, data intake, and curation support were established.
    - Developed and refined custom metadata blocks, improved field display controls, and integrated external previewers for enhanced dataset usability.
    - Completed multiple rounds of metadata harvesting, partnered with key organizations for data sharing, and supported API-driven data integration.
    - Addressed, opened, and resolved diverse GitHub issues supporting technical and curation features, including enhanced dataset review workflows and metadata field controls.
    - Strengthened community engagement through targeted outreach, onboarding, collaborative datathons, newsletters, and increased repository visibility.
- Participants: Sonia Barbosa, Emily Katz, Alexis Guanche, Ceilyn Boyd
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/161

Kaggle/Croissant

"Croissant is a high-level format for machine learning datasets that brings together four rich layers." The goal of this project is to make datasets easier to find and work with for Machine Learning, at scale and by diverse stakeholders (e.g., AI engineers, AI ethicists[e], compliance managers, interested public) by sharing Dataverse installation metadata in Croissant format.

- This fiscal year, the Kaggle/Croissant project focused on implementing and enhancing Croissant export support in Harvard Dataverse, promoting machine-readable metadata and facilitating deeper integration with platforms such as Kaggle and Google Dataset Search. Collaborative efforts with the Croissant and CODATA communities advanced interoperability, usability, and metadata standards. Key accomplishments include the following:
    - Integrated the Croissant exporter into Harvard Dataverse and ensured indexing by Google Dataset Search.
    - Enabled Croissant metadata export for draft datasets via the API and improved draft handling.

    - Established partnerships and ongoing discussions with Kaggle, CODATA, and the Croissant Task Force to align development and community objectives.
    - Facilitated contributions upstream by completing the Contributor License Agreement, attending working group meetings, and submitting multiple pull requests.
    - Supported community engagement through technical presentations and targeted feature requests.
- Participants: Phil Durbin
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/163

Pilot Large Data Support Service

This pilot project designed and implemented a large data support service model and technical support for the Harvard Dataverse repository using NESE tape and disk resources.

- During FY25, the Large Data Pilot aimed to establish and streamline services, workflows, and technical infrastructure to support the curation, storage, and sharing of large research datasets. Significant progress was made in developing service protocols, technical solutions for NESE and Globus, and supporting diverse large data collections. During FY25, team accomplishments across curation and development include:
    - Developed and finalized the Large Data Service documentation and created a "Services" component on the HDV Support website for all related documentation.
    - Developed and finalized the Large Data Services intake form to standardize requests and project onboarding.
    - Completed and published curation for the DrivAerNet and OMAMA datasets, with tailored download and curation instructions.
    - Established and tested NESE and Globus support, including successful uploads and downloads in production environments.
    - Quoted and initiated support for the Bertarelli collection, including project scoping for 10TB NESE disk storage.
    - Integrated IT/RT Support processes for large data services, ensuring comprehensive technical and user support.
- Participants: Leonid Andreev, Sonia Barbosa, and Ceilyn Boyd
- Status: Completed
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/178

Establish Harvard Pre-Peer Review Program (PPR) Support

rapidPeer is a free service at Harvard's Institute for Quantitative Social Science (IQSS) offering double-blind peer reviews of research with either a quantitative or qualitative focus* in 30 days by field-specific experts at leading institutions. This project aimed to shift the ongoing development and maintenance for the Harvard Peer Pre-Review Program (HPPRP) software from a temporarily assigned IQSS Sid developer to a Dataverse Project developer and or DevOps engineer with relevant expertise.

- This fiscal year, the Establish Harvard Pre-Peer Review Program (PPR) Support project focused on knowledge transfer, documentation, infrastructure setup, and planning for ongoing maintenance and support of the PPR system. Milestones spanned successful technical hand-offs, documentation completion, and process improvements to ensure the sustainability and enhancement of PPR operations. During FY25, the team:
    - Completed development and devops hand-offs as well as thorough knowledge transfer to new team members.
    - Finalized comprehensive software and workflow documentation for the PPR system.
    - Created, updated, and organized code and project management repositories to streamline collaboration.
    - Successfully migrated all tickets from Smartsheet to the GitHub project management repository.
    - Evaluated the vulnerabilities and strengths of the current plugin, with ongoing discussions and planning for system improvements and future maintenance.
- Participants: Rebecca Nichols, JP Tosca, Steve Winship, Ceilyn Boyd
- Status: Completed
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/204

Dataverse Marketplace

This project aimed to establish a Dataverse app store or Marketplace, enabling developers to share tools, scripts, and other elements with users, allowing them to personalize their collections or installations and easily enable new features via plug-and-play.

- In FY25, the Dataverse Marketplace project made significant strides in planning, designing, and developing an MVP platform to support the discovery and integration of external tools with Dataverse. Over the course of the year, core design principles were established, technical features were implemented, and key infrastructure was put in place to support scalable, secure, and user-friendly access to tools for the Dataverse community. Accomplishments included:

    - Completed and reviewed MVP design and established plans for backend architecture.
    - Implemented server, database, user authentication (JWT), and API endpoints for tool and user management.
    - Launched webservice and deployed https://marketplace.dataverse.org/ with OpenAPI/Swagger UI and continuous integration via GitHub Actions.
    - Added support for trusted users, manifest metadata handling, and initial implementation of React UI.
    - Delivered a Dataverse Community Meeting presentation to showcase the marketplace progress.
- Participants: Gustavo Durand (lead), JP Tosca
- Status: Ongoing
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/278

Bertarelli Foundation Large Data Project

This curation project aimed to onboard datasets and collections from the Bertarelli Foundation to the Harvard Dataverse repository. Elements of the project included hosting large data collections and harvesting datasets from other repositories.

- In FY25, the Bertarelli Foundation Curation Project focused on enabling the harvesting, curation, and storage of large research datasets for the Bertarelli Foundation community. The team made significant progress in developing technical solutions for metadata harvesting, scaling storage infrastructure, and providing direct support and guidance to project members. During FY25, the team:
    - Developed and shared large data storage estimates and configured NESE Disk support for the collection.
    - Initiated and advanced technical work for harvesting datasets via the DataCite OAI-PMH API.
    - Delivered a proof-of-concept for automated harvesting of Bertarelli collection datasets.
    - Conducted outreach, including a webinar and scheduled biweekly office hours, to support project members' data deposit needs.
    - Collaborated closely with project teams (e.g., Tritonia) to review large data workflows and facilitate data upload and packaging.
- Status: In Progress

- Tracking issue: https://github.com/IQSS/dataverse-HDV-Curation/issues/582

OnDemand Loop: Open OnDemand (OOD) and Dataverse Integration Proof-of-Concept

- In FY25, the OnDemand Loop Prototype Project was initiated to prototype an integration between Harvard Dataverse and Open OnDemand (OOD), with a focus on real-world use cases for data transfer, discovery, and API-based workflows. Over the year, the team made significant progress on project planning, the technical implementation of essential use cases, and laying the groundwork for an open-source release. During the year, team members:
    - Assembled the project team and successfully secured proposal approval.
    - Defined MVP requirements, focusing on public datasets and API-based workflows.
    - Completed the technical development of five major use cases (DV-OOD-01 through OOD-DV-05).
    - Established a dedicated project repository and adopted two-week sprint cycles for agile development.
    - Shifted focus to preparing project infrastructure for open source distribution.
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/338

Design and Implement Dataverse External Search

- This fiscal year, the Dataverse External Search Investigation focused on the design, prototyping, and testing of a flexible search plugin interface (SPI) for supporting multiple external search engines. Additionally, the improvements demonstrate promise in supporting AI search, as described in the following presentation given at the Dataverse Community Meeting, 2024: "External Search". The initiative emphasized incremental development, usability for both developers and end-users, and extensibility for future search technologies.
    - Drafted and revised an incremental design proposal for an SPI, enabling integration with multiple external search engines.
    - Developed a prototype implementation allowing external search classes to call out via GET or POST, with enhancements for accepting DOIs/PIDs and search result weighting.
    - Integrated functionality for SPA and API users to select their preferred search engine and coordinated demonstration of the SPA interface for search service selection.

    - Enabled test and production search engines to be built as separate jars, improved the build process, conducted thorough testing, and deployed new features to QA.
    - The External Search PR was reviewed, QAed, and merged into the Dataverse 6.7 release.
    - Presented project progress at the Dataverse Community Meeting and finalized code cleanup, documentation, and release notes.

- Participants: Jim Myers (lead)
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/279

Migration Tool and Service

- This year, the project was launched to develop tools and workflows for migrating repositories and datasets, with a focus on supporting institutional needs, such as the migration of the SAA Dataverse collection from UNC to the Harvard Dataverse. Over the reporting period, foundational technical work and cross-institutional collaboration set the stage for a robust migration service. During FY25, Jim Myers and other team members:
    - Initiated technical investigation of migration tool options and requirements.
    - Started initial development as a new API call within Dataverse for dataset and repository migration.
    - Held a collaborative meeting between UNC and Harvard teams to plan SAA Dataverse collection migration, agreeing on shared support and necessary workflow enhancements.
    - Created a dedicated development branch and implemented an API endpoint to retrieve information from remote servers.
    - Added ancillary code for test-driven development, including support for test DOIs in migration scenarios.
- Participants: Jim Myers (lead), Sonia Barbosa, Ceilyn Boyd
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/355

DP Wizard

- This fiscal year 2025, the project designed and implemented a new DP Wizard application that uses Python and Shiny. The design and development process followed an iterative approach and underwent user testing with approximately 10 users, as

planned and coordinated by a graduate student. The project was deployed on https://github.com/opendp/dp-wizard and PyPI: https://pypi.org/project/dp_wizard/.

- Participants: Chuck McCallum, Ellen Kraffmiller, Phil Durbin, Cheng Shi, Ceilyn Boyd
- Status: In Progress
- Tracking issue: https://github.com/IQSS/dataverse-pm/issues/331

Dataverse and Harvard Dataverse Metrics Overview

Dataverse Development Metrics

Time period: 2024-07-01 - 2025-06-30

- # Issues created: 495 (FY24: 507, ↓ 1.2%)
- # Issues closed: 828 (FY24: 745, ↑ 5.28%)
- # PRs created: 437 (FY24: 456, ↑ 2.13%)
- # PRs merged: 408 (FY24: 390, ↑ 2.26%)
- # Bugs closed: 130 (FY24: 172, ↓ 13.91%)

Harvard Dataverse Repository Highlights

Time period: 2024-07-01 - 2025-06-30

- # Dataverse Installations: 137 (FY24: 120, ↑ 14.2%)
- # Collections in Harvard Dataverse: 11,366 (FY24: 9,340, ↑ 21.7%)
- # Datasets in Harvard Dataverse: 127,733 (FY24: 112,899, ↑ 13.1%)
- Total Files in Harvard Dataverse: 3,588,427 (FY24: 2,648,601, ↑ 35.5%)
